Token supply forensics — Robinhood Chain, Base, Ethereum

Who really holds it?

One map of every top holder. Wallets that trade with each other, share a funder or buy in the same block are joined by a red line. No line, no link.

Contract address or ticker

0x… / $TICKER

Map it

Supply, split honestly.

Example token. Exchange and pool wallets are set aside so they never fake a cluster.

6.2%	4.1%	9.2%	6.5%	74%
Case 1 · sniper ring	Case 2 · deployer	DEX pool (exempt)	CEX (exempt)	Free float

01 Scan

Top 250 holders, labelled: exchange, pool, burn, contract, deployer.

02 Link

Transfers, shared gas funders and launch-block buys draw the lines.

03 Seal

The result is hashed and anchored on Robinhood Chain. Verifiable forever.

Pull the string.

69 /100 Moderate

Decentralization score

69

0 High 40 Moderate 70 Low · 100

One point short of Low risk. The biggest drag is a 9-wallet group that bought in the launch block and still holds 6.2% of supply.

How the score is built

Start at 100. Each factor takes points off. Exchange, pool and burn wallets are excluded.

Factor	Value	Rule	Points
Largest linked group Group 1 · 9 wallets	6.2%	-1.5 × %	-9.3
Deployer-linked supply Group 2 · 3 wallets	4.1%	-2 × %	-8.2
Launch-block buyers Still holding	6.2%	-1 × %	-6.2
Groups with 5+ wallets Groups 1 and 3	2	-2 each	-4.0
Fresh-wallet farms Group 3 · one gas funder	2.9%	-1 × %	-2.9
Top 10 non-exempt holders	10.0%	-0.5 × (% - 20)	0.0
Liquidity vs market cap	7.4%	-10 if under 5%	0.0
Score		100 - 30.6	**69**

Group 1 · 6.2%

9 wallets, same block

All nine bought in block 45,301,118, the same block liquidity was added. Six have since moved tokens between each other.

Group 2 · 4.1%

Deployer and two wallets

The deployer sent tokens to two wallets at launch. One of them shares a gas funder with a Group 1 wallet.

Group 3 · 2.9%

14 fresh wallets

Each was funded with gas from 0x3e1d…19b0 within an hour, then bought within 40 blocks of each other.

Linked means connected by on-chain activity, not proven to be one owner. Projects can dispute a label at redstring/dispute. Scores are a heuristic, not financial advice.

Verify it yourself

01

Download the snapshot JSON.

02

Hash it with keccak256. It must match the snapshot hash.

03

Apply the Merkle proof. You get the batch root.

04

Find that root in the tx's `Anchored` event.

```
npx redstring-verify --snapshot example-45543520.json --tx 0x77c4…e21a --chain 4663
✓ snapshot hash matches   ✓ proof valid   ✓ root found in Anchored event
```
